Acquiring RDF data – report

1. Assumptions

The data is about science-fiction TV series.

The assumption I made is that the science-fiction genre is only limited to 2 values (included in the *FILTER* in the main query). Besides that, I just entered “Doctor Who” in Google and went to Wikipedia page (https://en.wikipedia.org/wiki/Doctor_Who), then started building query like you did in the presentations.

2. SPARQL Queries

Here are my SPARQL queries.

2.1. Main Query

```
SELECT ?movie MIN(?country1) AS ?country MAX(?sea1) AS ?sea MIN(?star1) AS ?star
WHERE {
  ?movie rdf:type <http://www.wikidata.org/entity/Q15416> .
  ?movie dbpedia2:genre ?genre .
  ?movie dbpedia2:country ?country1 .
  OPTIONAL { ?movie dbpedia2:numSeasons ?sea1 . }
  OPTIONAL { ?movie dbpedia2:starring ?star1 . }
  FILTER ( ?genre = "Science fiction"@en || ?genre = <http://dbpedia.org/resource/
Science_fiction> )
} ORDER BY ?movie
```

2.2. Other Queries

Queries for comparing other TV series:

```
SELECT * WHERE {
  :The_Flash_\(2014_TV_series\) ?x ?y .
}
```

```
SELECT * WHERE {
  :Altered_Carbon_\(TV_series\) ?x ?y .
}
```

```
SELECT * WHERE {
  :The_Expanse_\(TV_series\) ?x ?y .
}
```

3. Characteristics of the Obtained Set

The variables are:
- **?movie** - the name of the TV series (I know it's not technically a movie)
- **?country** - the country of production
- **?sea** - number of seasons
- **?star** - the main actor (star)
- **?genre** - genre of the TV series (set to science-fiction)

There are about 900 rows (sci-fi series) in the results.

There are some missing data, that's why I added *OPTIONAL* keyword, particularly in number of seasons and the star. The *genre* variable could be counted as special as it is not displayed and could take 2 values.

4. Additional Remarks

- The <*http://www.wikidata.org/entity/Q15416*> entity is a television program.
- I checked why some science-fiction TV series I know are not included in the results - it was because they had different genres like *:Cyberpunk* (for *Altered Carbon* series) or *"Science fiction"@en* (which I included in filters) .
- I thought that *Doctor Who* would have the most number of seasons in the sci-fi genre but when I sorted the data by number of seasons, the most seasons had the show `:Pleasant_Goat_and_Big_Big_Wolf :China 37`. Of course if we count the old Doctor Who series, then it has even more (26 + 15 = 41). However, in the data it would be difficult, if even possible, to set it up.
- The PDF I created was written in Typst - I highly recommend it for writing PDFs, it's similar to Markdown and Latex but easier to write as it uses functions like in programming.
- You have the option to export to JSON in snorql too ;) It's here in the *Results: Browse*:
